(54) Title: IMPROVED FERTILITY RESTORATION FOR OGURA CYTOPLASMIC MALE STERILE *BRASSICA* AND
METHOD

(57) Abstract: A *Brassica* plant comprising a unique recombination event resulting from a break at a position along a nucleic acid
segment derived from *Ogura Raphanus sativus* between the restorer locus and the glucosinolate locus and subsequent rejoining to
produce a new recombination event, BLR1. The BLR1 recombination event expresses fertility restoring resulting from expression of
the restorer gene derived from *Raphanus sativus* and a GSL content no higher than normal double low open pollinated varieties. The
Brassica inbred line BLR-038, Deposit Number NCIMB-41193, is one example of a plant that contains the BLR1 recombination
event. The BLR1 recombination event is introgressed into different *Brassica* genetic backgrounds using breeding techniques known
to those skilled in the art. For example, the *Brassicainbred* line BLR-038 or another *Brassica* plant containing the BLR1 recombi-
nation event may be crossed with male sterile inbreds to produce hybrids expressing low GSL content and superior agronomic traits.
